

### **ABSTRACT OF DISCLOSURE**

The present invention is a home delivery service system and a method thereof. The home delivery service system is provided with a mailbox connected to an external device, controlling opening and closing of a lock formed at a door of the mailbox in accordance with a signal received from the external device. The system receives a set of figures input through a key input unit of a body of the system and transmits the input figures to the external device. The home delivery service system also includes a web service provider, a storage unit for storing a password, and a data processing/authentication unit performing a communication with the mailbox. When the set of input figures transmitted to the mailbox match the password stored in the storage unit, an open-signal is transmitted to the mailbox indicating to unlock the lock.
